ABSTRACT:
Objective: To determine the factors influencing the choice of Ophthalmology as a career amongst Dow University of Health Sciences, Karachi.

Study design and Setting: A descriptive cross sectional study was conducted on fourth and final year students of Dow Medical College, DUHS, Karachi through non-probability consecutive sampling technique.

Methodology: Before conducting the study, permission from the Principal of Dow Medical College, Dow University of Health Sciences was taken. Overall 244 students were selected willing to participate in the study after having their written consent. A structured questionnaire with minor modification and after pretest was provided to them. All the information was filled by the student on their own reliability. The collected data was analyzed through SPSS version 21.0. The quantitative data was assessed through mean and standard deviation whereas frequencies and percentages were developed for qualitative data. Chi square test was applied to determine any significant correlation between different variables.

Result: According to analysis of the data, 77% female and 23% male medical students of fourth and final year participated in the study. Overall 8.65% students were given their first choice of Ophthalmology which is at 4th rank in all specialties after internal medicine, cardiology and paediatrics. The major factors which influence them to select Ophthalmology as their first choice were high income, less working hours and experience of medical and surgical field. The major factors, which restrict them not to choose Ophthalmology as a career, were less opportunity of residency, long duration of residency and less opportunity at private sector.

Conclusion: Ophthalmology is at 4th rank in the choice of participated medical students. The factors attracted them to choose it were high income, less working hours and no night shift. However less opportunity of residency and less working opportunity at private sector restricted them not to choose the ophthalmology as their career.

Keywords: career choice, future career, Medical education, medical students, Ophthalmology and specialty choice.

INTRODUCTION:
The choice of any medical specialty taken as future career is the key worldwide which has to be decided normally by medical students at their graduation level. This is also decided on the basis of availability of seats for each category. World Health Organization recommended Physician to population ratio as 23:10,000. Many factors influence the medical students to select their particular speciality. Generally there are two main groups, one which is related to the personal interest, gender and their priority and second one is related to the environment in which they are working along with load of patients in their circumstances, their life style, less on calls and night working days. Even in United Kingdom, medical students while considering a choice of their career, the main important factors are short working days and job perception by the other people. In a study conducted in Nepal, the main influencing factors in medical students for selecting a speciality as their career were gender, marital status, availability of jobs abroad, job security and future scope. Gynaecology and ophthalmology were the best choices of female Nepali medical students as compared to males whose choices were Orthopaedics, General Surgery and Internal Medicine. The other influencing factors were workload flexibility and illness of a family member or a friend. In another study conducted in Jordan, competency of the individual and reputation of speciality were the main influencing factors to determine their choice of future planning. In this study, male’s first choice was General Surgery whereas female’s first choice was Gynaecology. Studies conducted in Saudi Arabia on students and new graduates determined that General Surgery,
Paediatrics and ophthalmology were their best choices whereas main factors influencing for that were personal interest, flexibility of working hours, cultural values, speciality characters, prestige of the speciality and anticipated income. Similarly ophthalmology was the best choice due to shortage of Ophthalmologist in the country. In another study conducted in Nigeria\textsuperscript{13, 14} the influencing factors in selecting ophthalmology as speciality were personal interest, life style and opportunity of surgery along with medicine. In a study conducted in Kenya\textsuperscript{15}, work environment and pressure of family and friends were the main factors in selecting the career choice.

A very scattered regional literature focusing on the career choice of medical students is available. In a study conducted in Kolkata, India\textsuperscript{16}, the main influencing factors were self-interest and passion. In another study\textsuperscript{17} conducted in Iran, personal development, interest, motto of helping people, income and prestige, easiness and comfortable job were the most influencing factors in selecting the future career. Studies from Pakistan\textsuperscript{18, 19, 20} were also showing different results. The main influencing factors were suited to personality, time commitment, prestige/respect and international opportunity having ophthalmology as only preference by 2.3% participants. However these studies were done from first to final year students. This study was designed to determine the factors influencing the choice of ophthalmology as a career among medical students of Dow Medical College, Karachi.

**METHODOLOGY:**

A cross sectional analytical study was conducted on students of Dow Medical College, Karachi through non-probability consecutive sampling technique. Overall 244 students of fourth and final year MBBS were selected for the study who gave the consent to participate. A self-administered semi-structured questionnaire comprising demographic data, questions regarding their future choice of specialities preferences and factors influencing them or restrict them to choose ophthalmology as a preference was distributed to all the information was filled by the student on their own reliability. The collected data was analyzed through SPSS version 21.0. The quantitative data was assessed through mean and standard deviation whereas frequencies and percentages were developed for qualitative data. Odd ratio at 95% confidence interval along with significance value at $P<0.05$ was calculated to determine the difference factor influencing them to choose ophthalmology or any other field.

**RESULT:**

Over all 244 students were equally selected from fourth and final year MBBS classes through non-probability consecutive sampling method. Mean age of the student was $22.72\pm0.48$ years. Majority of the participants were females $n=188$ (77.0%) while males were $n=56$ (23%). 89.3% were satisfied with their choice of medical field, and only 44.7% select this field as they wants to go abroad. Only 8.6% students have chosen ophthalmology as their first choice of career.

To determine the factors which either influences them to choose or not to choose ophthalmology as a career, different questions were asked. In response to first question whether part time work opportunities in ophthalmology are available or lacking, majority (62.3%) said no part time opportunities are there as compared to other fields. In reply to a question regarding whether you have seen any Ophthalmologist as a role model satisfying family life, replies of majority (70.9%) was no. 35.7% think that it is difficult to get a residency in ophthalmology. Majority of the respondents think that ophthalmology speciality has high income, personal experience in that field (56.1%), and portrayal of different specialties in the media (51.6%). However 57.8% respondent students were of the view that the length of residency is more and 73.0% said that opportunity in private sector for ophthalmology is less. (Table 1)

In comparing the choice of all fields of specialist, Ophthalmology came at no.4 after internal medicine, cardiology and pediatrics for the medical students as first choice of their career in future where they can experience for medicine and surgical procedures both. (Fig 1)

DISCUSSION:

Medical students are a country’s future physician reservoirs. Knowing how they choose their specialties is the key in enforcing a balance in distributing physicians in different medical specialties. Students of medical colleges have to select their medical specialty during their study with concern to their like and dislike, job opportunities for professional, income dignity of the profession. Amongst them, Ophthalmology is a major one which has grown exponentially more competitive, especially with the low capacity of training centres.

According to a study conducted in Saudi Arabia, majority of participated students were males (65.5%) and females on 34.55 with mean age of participants was 23.5±1.7. In another study, 45.6% were males and 54.4% were females with mean age 23.7±1.54 years. In our study majority (77%) were females and only 23% were males with mean age 22.72±0.48. The reason for more females is admission ratio where it is around 80/20 for females and males.

In the same study, ophthalmology was the first choice for 10.2% students, while 44.7% wanted other medical specialities and 40.3% preferred surgical specialities. In another study ophthalmology was on second preferred choice of medical student after dermatology i.e. 14.4%. In study of United Kingdom, ophthalmology was found the first choice of long term career for 2.3% of male and 1.5% of females one year after qualification. It was just 0.9% in 1974 which has now become 2.3%. In a study of Nigerian students, 32.5% opted for ophthalmology after their one year youth service. In our study ophthalmology was the first choice of 8.6% students whereas 56.5% wanted other medical speciality and 34.9 preferred surgical speciality. The difference is due to male female ration in our set up as compared to others. In different studies it was also found that females were less interested in ophthalmology.

Multiple factors influenced medical students' choice when choosing a future speciality. Knowing these factors can help in directing work-force to choose specialities that are currently limited. There are different factors which either influences the student to choose or not to choose ophthalmology as their speciality in future. According to a study, the factors which influence the student for choosing ophthalmology was high-income earning with as much as 54% of the participants giving it credit followed by private sector opportunities (40%), part-time opportunities (40%) and leisure (34%). In a study conducted in Iran, economic factors were deemed the most important factors in choosing ophthalmology as their specialties. In a study, the factors influencing them to choose ophthalmology as a specialty was their commitment with their work strengthened by the prospect of attractive hours and working conditions. In Nigerian study, the factors that influenced their choice of specialty as ophthalmology was mainly interest in the speciality (85%), opportunity to combine medicine and surgery (33.8%) as well as life style (42.5%). In our study, Majority of the respondents who choose ophthalmology as their specialty think that ophthalmology specialty has high income (84%), personal experience in that field (56.1%), and portrayal of different specialities in the media (51.6%).

There are some negative factors like difficulty of getting into the ophthalmology. According to a study, ophthalmology...
Residency Program (53%) was the most important factor that pushed students away from choosing ophthalmology. In our study, 57.8% respondent students were of the view that the length of residency in more and 73.0% said that opportunity in private sector for ophthalmology is less and there is major difficulty of getting into ophthalmology residency.

CONCLUSION:
Ophthalmology is at 4th rank in the choice of participated medical students. The factors attracted them to choose it were high income, less working hours and no night shift. However less opportunity of residency and less working opportunity at private sector restricted them not to choose the ophthalmology as their career.
